Executive summary

Metolachlor is a selective herbicide with broad weeding spectrum, high effectiveness and wide application fields. According to statistics from the Institute for the Control of Agrochemicals, Ministry of Agriculture and Rural Affairs of the People's Republic of China (ICAMA), as of March 2022, a total of 169 valid registrations of metolachlor have been licensed in China, including 18 for technical, 75 for single formulations and 76 for mixed formulations.

The capacity of metolachlor technical in China increased from 23,300 t/a in 2016 to 37,000 t/a in 2018, yet dipped to 29,800 t/a during 2019–2020 and rose to 30,800 t/a in 2021. The output peaked in 2017, but kept below 10,000 tonnes during 2019–2021.

Metolachlor products made in China are export-oriented. Export volume of metolachlor (calculated by 97% technical) in China increased to about 27,225 tonnes in 2017. After a plummet in 2019, it increased to about 12,543 tonnes in 2020. Though large increase was witnessed in 2020, the export volume was still at a low level compared with that in 2017 and 2018.

Regarding metolachlor price in China, prices of both metolachlor technical and metolachlor formulations were on a general increase in 2016–2018. However, in 2019, the annual ex-works price of 97% metolachlor technical decreased to USD3,418/t and dipped further to USD3,309/t in 2020, which was the bottom in the past six years. The annual price rocketed to about USD5,000/t in 2021, and the market saw volatile monthly prices.

In China, metolachlor technical is applied on crops through single formulations of 720g/L EC and 960g/L EC and mixtures of the product with bensulfuron-methyl, atrazine and mefenacet. And metolachlor is mainly applied on corn, vegetables, soybean and some other cash crops in China. In 2021, the consumption volume of metolachlor technical in China edged higher to 3,521 tonnes, up by 0.57% year on year. The consumption of metolachlor technical in corn and vegetables accounted for more than 60% of the total consumption in China.

With increasing demand and some barriers to a jump in metolachlor supply in China, it is predicted that the output of metolachlor technical in China will increase in the next four years and then decrease in 2026. It's unlikely to see too much increase in both supply and demand in China during 2022–2026.

Methodology and source

This report is drafted by diverse methods as follows:

(1) Desk research

The sources of desk research are various, including published journals, government statistics, industrial statistics, Customs statistics, as well as information from the Internet. Obtained information has been compiled and analysed. When necessary, checks will be made with Chinese metolachlor suppliers regarding market information such as key producers, production and price trend, etc.

(2) Telephone interview

Extensive telephone interviews have been carried out in order to grasp the actual market situation of metolachlor in China.

Interviewees cover:

- Producers
- Traders

(3) Internet search

CCM contacted with the players in this industry through B2B websites and software.

Data processing and presentation

The data collected and compiled were sourced from:

- a. Published articles from periodicals, magazines and journals
- b. Statistics from local governments and international institutes
- c. Telephone interviews with domestic suppliers, traders, industrial experts
- d. Third-party data providers
- e. Information from the Internet

Data obtained from various sources have been combined and cross-checked to make this report as precise and scientific as possible. Throughout the process, a series of internal discussions were made in order to analyse the data and have conclusions drawn.

1 Overview of metolachlor industry in China

1.1 Brief introduction to pesticide industry in China

- Supply and demand

In 2017, China's herbicide industry shriveled as the central government introduced a string of regulations and policies targeting pesticide industry. Even so, China is still a major herbicide supplier globally. The herbicide output (calculated by 100% technical) was 1,004,000 tonnes in China in 2020, down 0.69% year on year.

As a category of pesticides, herbicides have been playing an increasingly important role in the prevention & control of weeds. The structure of pesticide products in China used to be so imbalanced that the output of insecticides accounted for an extremely large proportion of the whole market, while proportions of other types of pesticides were quite small. For example, in 1994, China's output proportions of insecticides, herbicides and fungicides (calculated by the most frequently used technical) were around 76.4%, 13.0% and 9.5% respectively.

Along with structural adjustment of the pesticide industry and development of products with higher added value and efficacy in recent years, the structure of pesticide output in China has improved. The output structure of pesticides in China has changed fundamentally and the output proportion of herbicides has risen greatly. In 2020, China's output proportion of herbicides (calculated by 100% technical) was around 46.74%, herbicides remaining the largest pesticide category.

Figure 1.1-1 Output and demand of herbicides in China, 2016–2020

1.2 Position of metolachlor in China's herbicide industry

In 2020, the output of herbicides in China shrank slightly, while the output of metolachlor technical was basically flat with the previous year. And the share of metolachlor in the herbicide industry (based on output) rose from about 0.91% in 2019 to about 0.97% in 2020. The share of metolachlor export volume in herbicide export volume increased from about 0.58% in 2019 to about 0.98% in 2020.

3 Supply

3.1 Production technology

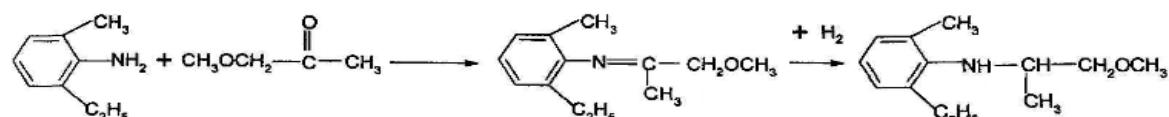

At present, three major methods for producing metolachlor technical have been reported: the methoxyacetone route, the 2-chlorine propanol route and the 2-bromo-1-methoxyl propane route. Among them, the methoxyacetone route has been put into industrial production and adopted by the producers in China.

Figure 3.1-1 Methoxyacetone route for producing metolachlor technical

Figure 3.1-3 2-Bromo-1-methoxyl propane route for producing metolachlor technical

Source: *Herbicide Volume, Corpus of Global Pesticides*

Table 3.1-1 Comparison of different routes for producing metolachlor technical

Route	Advantage	Disadvantage
Methoxyacetone route	a. The raw materials used are low-toxic. b. The yield coefficient of catalytic hydrogenation (step 2) is high. c. The general yield coefficient is high.	Attrition loss of catalysts will increase the cost of production.
2-Chlorine propanol route	/	a. The 2-chlorine propanol needed is highly toxic and volatile. b. The yield coefficient of step 2 is low.
2-Bromo-1-methoxyl propane route	Fewer reaction steps	a. Requirements for equipment are high in process. b. The waste gas (HBr) is toxic.

3.2 Production of metolachlor in China, 2016–2021

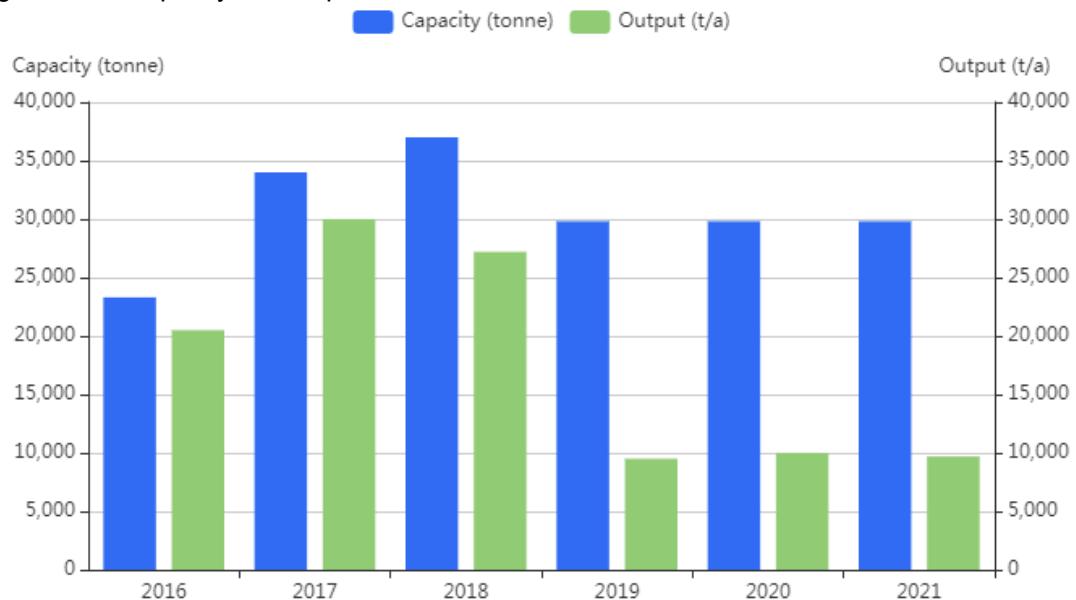

During 2016–2021, the capacity and output of metolachlor technical in China enjoyed growth first, then followed a downturn mainly due to decreasing demand from abroad. The capacity increased from 23,300 t/a in 2016 to 37,000 t/a in 2018, yet dipped to 29,800 t/a during 2019–2020 and increased to 30,800 t/a in 2021. The output of metolachlor technical peaked at 30,000 t/a tonnes in 2017 but declined to about 9,700 tonnes in 2021.

In 2020, there were five metolachlor technical producers in China, which are located in Shandong, Zhejiang and Anhui provinces. In 2021, there came a new player—Nantong Jiangshan Agrochemical & Chemicals Co., Ltd., located in Jiangsu Province. Its 1,000 t/a metolachlor technical production lines entered the commissioning stage in Nov. 2021.

Previously, on 3 July, 2020, the Binhai Branch of the Ecology and Environment Bureau of Weifang City approved the environmental impact assessment report of Weifang Sino-Agri Union Chemical Co., Ltd.'s 12,000 t/a herbicide TC project, including 6,000 t/a 98% metolachlor TC. However, in Oct. 2021, only devices for 1,000 t/a prosulfocarb TC completed construction and passed environmental protection acceptance; the company dropped the plan of new capacity for other products.

It is noteworthy that the pressure from environmental protection has been heavy. Some metolachlor producers in China had to suspend their production from time to time. It is believed that environmental protection will continue to be the chief barrier to metolachlor industry in China in the near future.

4 Circulation

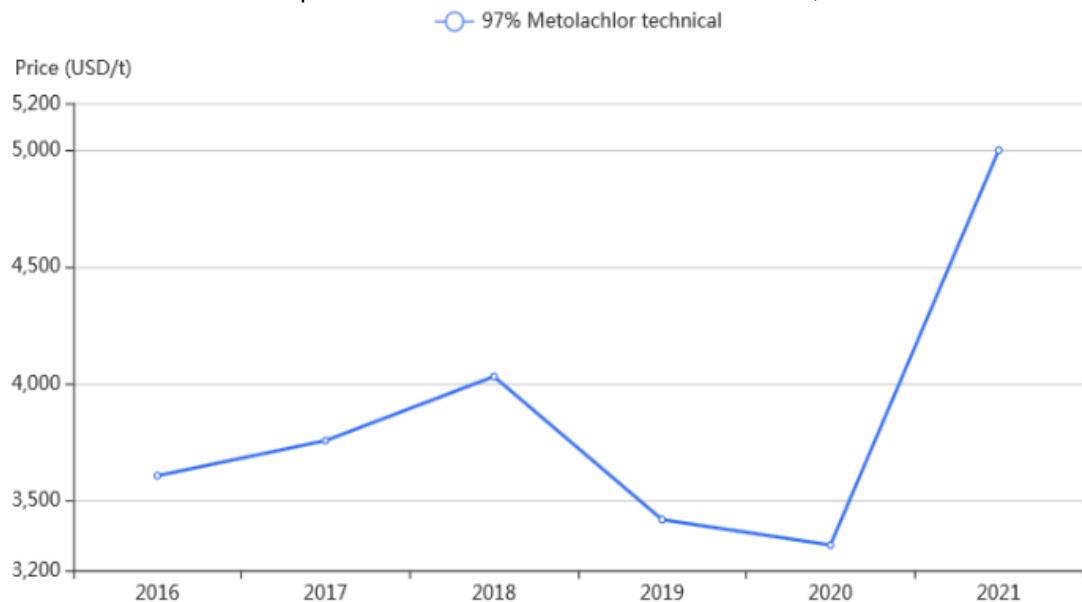

4.1 Prices of metolachlor technical, 2016–2021

In 2016–2018, prices of both metolachlor technical and metolachlor formulations were on a general increase. Specifically, the annual average ex-works price of 97% metolachlor technical rose from USD3,606/t in 2016 to USD4,030/t in 2018. In Feb. 2018, monthly ex-works price of 97% metolachlor technical increased to USD4,679/t. For one thing, stringent environmental inspection has pushed up the price. For another, increasing demand from overseas market also drove up the price. Yet later in 2018, as the new capacity of Anhui Zhongshan Chemical Co., Ltd. was put into production, the price of metolachlor technical began to decline.

In 2019, the annual ex-works price of 97% metolachlor technical decreased to USD3,418/t, decreasing by about 15.20% year on year. And it dipped further to USD3,309/t in 2020, which was the bottom in the past six years. The key reason for the price fall was the overall downturn in demand for metolachlor products in foreign markets in 2019, and thus metolachlor supply in domestic market exceeded the demand.

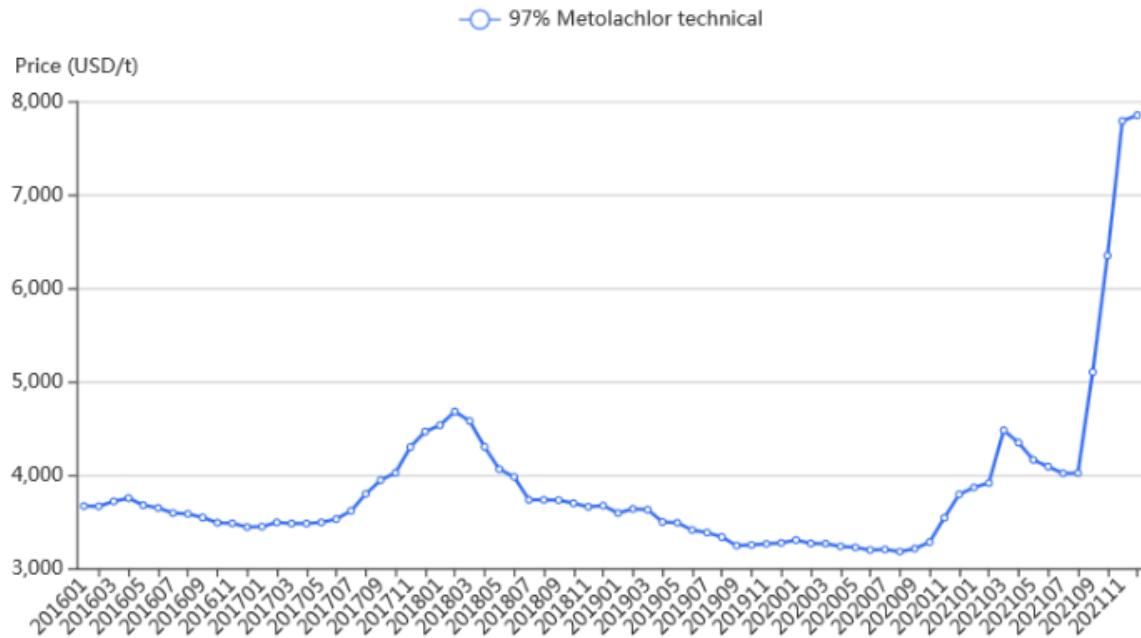

The annual ex-works price rocketed to about USD5,000/t in 2021, and the market saw volatile monthly prices. The Dec. 2021 price surged to USD7,850/t due to high production cost and limited supply, more than double the Dec. 2020 price. As the price of its raw materials kept high in recent months, the price of metolachlor technical will fluctuate at a high level in the near future.

4.2 Exports of metolachlor, 2016–H1 2021

Metolachlor products made in China are export-oriented. In 2016–2018, the share of annual export volume of metolachlor (calculated by 97% technical, the same below) against the national total output went up continuously, reaching 92.42% in 2018. The share dipped to slightly over 60% in 2019, but bounced back strongly in 2020. In China, 95% technical, 96% technical, 97% technical, 720g/L EC and 960g/L EC are the major specifications exported. Metolachlor technical is a popular product on overseas market at present.

The export volume of metolachlor (calculated by 97% technical) in China increased from about 5,899 tonnes in 2019 to about 12,543 tonnes in 2020. Though large increase was witnessed in 2020, the export volume was still at a low level compared with that in 2017 and 2018.

And it is worth noting that the US was the largest overseas market for China's metolachlor for most of the time in 2016–H1 2021. Shandong Binnong Technology Co., Ltd. was the largest exporter for China's metolachlor in 2016–2019.

Figure 4.2-1 Export volume of metolachlor in China, 2016–H1 2021

5 Consumption, 2016–2021

In 2021, the consumption volume of metolachlor technical in China has edged higher to 3,521 tonnes, up by 0.57% year on year. Notably, the growth slowed down in 2021 for the first time since 2016.

As a substitute for acetochlor in crop planting, metolachlor is becoming popular in China at present due to its relatively safer properties. That has driven up the domestic consumption of metolachlor technical in China since 2017. But it's worthy to note that there is a strong competitive product for metolachlor, namely S-metolachlor. Though the price of S-metolachlor technical is higher, it has better performance than metolachlor. In addition, pyroxasulfone, a preemergence herbicide, is also a potential competitive product for metolachlor that can be used in most crop fields. Its mechanism of action is similar to that of acetochlor and related herbicides, but its biological activity is far greater than that of acetochlor and metolachlor. And data show that it is not a endocrine-disrupting chemical.

Generally, metolachlor technical is applied on crops through single formulations of 720g/L EC and 960g/L EC and mixtures of the product with bensulfuron-methyl, atrazine and mefenacet on the domestic market currently. And metolachlor is mainly applied on corn, vegetables, soybean and some other economic crops in China. In 2021, the consumption volume of metolachlor technical in corn and vegetables accounted for more than 60% of its total consumption volume in China.

Figure 5-1 Actual consumption volume of metolachlor technical in China, 2016–2021

Note: Actual consumption volume of metolachlor is calculated by 97% technical.

6 Forecast on supply and demand, 2022–2026

- Supply

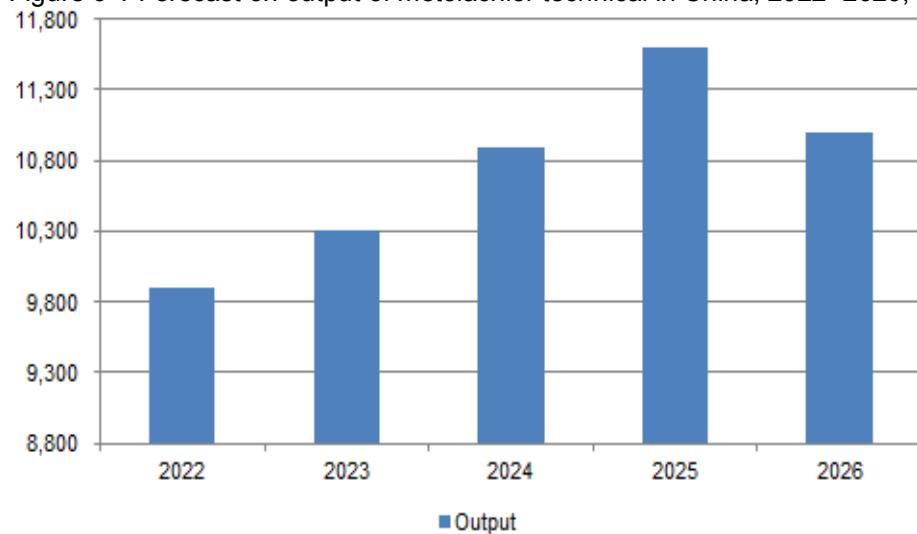

Because of draconian environmental inspection at home and increasing production cost, the supply of metolachlor technical in China has been relatively tight in 2021. Thanks to increasing demand at home, it is predicted that the output of metolachlor technical in China will increase in the next four years and then decrease in 2026.

As to capacity expansion projects, Nantong Jiangshan Agrochemical & Chemicals Co., Ltd.'s 1,000 t/a metolachlor production line has entered the commissioning stage, while Shandong Weifang Rainbow Chemical Co., Ltd.'s 5,000 t/a metolachlor project is under environmental impact assessment since some changes had been made to its original plan. The new capacity is expected to be gradually put into use in China before 2025.

However, there are also some barriers limiting the output increase in China. First, as metolachlor products made in China are export-oriented, decreasing overseas demand will impact manufacturers' confidence in the market. Second, S-metolachlor may undermine metolachlor's market competitiveness. Furthermore, increasingly strict environmental inspection in China puts greater pressure on metolachlor producers, since higher environmental cost must be taken into consideration.

Therefore, it's unlikely to see too much increase in the output of metolachlor in China in the following five years. It is estimated that the output of metolachlor technical in China will peak at 11,600 tonnes in 2025 and then start to fall in 2026.

Figure 6-1 Forecast on output of metolachlor technical in China, 2022–2026, tonne

Source: CCM

- Demand

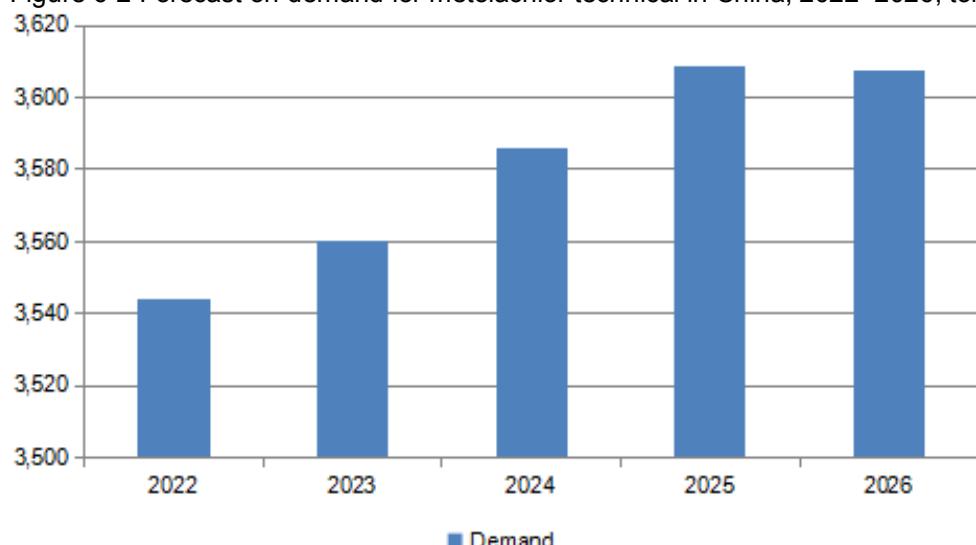

It's estimated that consumption of metolachlor technical in China will enjoy slight increase in 2022–2025 with more metolachlor being applied on crops as a substitute for acetochlor. But domestic demand for metolachlor technical may decrease in 2026.

Besides, the planting area of soybean, one of the main application fields of metolachlor on crops, will continue to increase under the implementation of soybean revitalization plan in China. With more soybeans being planted, more metolachlor will be needed in China. The Ministry of Agriculture and Rural Affairs of the People's Republic of China issued the Development Plan of National Planting Industry in the 14th Five-Year Plan Period (2021–2025) in Dec. 2021, which pointed out that China would strive to expand the soybean planting area to better satisfy the rapidly increasing demand. To raise soybean self-sufficiency level, China would strive to plant about 10.07 million ha (160 million mu) of soybean by 2025. This move brings good news to metolachlor consumption and will promote domestic demand at least in the near future.

However, it's believed that it's unlikely to see large increase in metolachlor consumption in China. Generally speaking, a major factor limits the growth of metolachlor consumption in China.

S-metolachlor is a strong competitive product of metolachlor. The more S-metolachlor is used in crops, the less metolachlor is needed. S-metolachlor is a selective herbicide with broad weeding spectrum, sharing similar herbicidal mechanism, application fields and application methods with metolachlor. It's deemed as an upgrade of metolachlor for its higher herbicidal activity and lower toxicity. In recent years, the S-metolachlor industry has been expanding in China, which can be reflected by the number of registrants. According to the ICAMA, there were only eight registrations of S-metolachlor (three for technical) in 2013, while the figure increased to 76 (24 for technical) as of Dec. 2021. And it's worthy to note that even for those potential producers of metolachlor, they expressed that they would not launch their metolachlor production lines immediately and would act according to actual needs. Moreover, they expressed that they preferred to have production lines of S-metolachlor at the same time.
